I was **diagnosed with prostate cancer in 1999**. My PSA was 6 and a biopsy showed cancer with a **Gleason score of 3+3**. Surgery was recommended (radical prostatectomy), but I was hesitant due to the main side effects of incontinence and impotence.

I spent the next several years getting second and third and fourth opinions and **trying many natural cures**. These didn't stop my PSA from rising, so I finally had the surgery in 2005. My PSA just before surgery was 17. After surgery it was undetectable.

After 2 years my PSA started to appear again. It should have stayed undetectable since I no longer had a prostate gland, so I agreed to have "salvage radiation" in 2008. Again my PSA became undetectable, but it started to appear again after two years (in 2010). This upgraded my condition to "advanced prostate cancer", since there is no known cure after surgery and radiation, only delaying procedures.

Throughout my cancer experience I was constantly searching for non-invasive treatments. One of my searches took me to the Poly-MVA site where I read encouraging testimonials, so I gave it a try. At 4 teaspoons a day my PSA seemed to be slowing, so I increased my dosage to 8 teaspoons a day.

Since I never had any symptoms from the cancer and was already feeling good and being very active, I didn't notice the increase in energy that others have noticed. However, Poly MVA has

had an incredible effect on my PSA, slowing the rise to almost no rise at all. This has prolonged my life to the extent that I may never need any additional treatment. Thanks to Poly-MVA.

My oncologist said I don't have to start any of the delaying procedures (hormone therapy or chemotherapy) until my PSA rises to 10 or a tumor is detected, so I'm trying to slow down the rate of rise. The rate of rise is measured by "doubling time" (the higher, the better) since the PSA usually rises exponentially.

### 5-08-2019

Called and talked to Jim to get an update on his status and how he is doing. He provided the following chart and comments that show how well Poly MVA is keeping his PSA levels in check.

#### JIM'S PSA CHART

As you can see by the chart and information below, **Poly-MVA has slowed the rate of rise**. It seems to be **rising linearly** instead of exponentially. This has been a great relief, since it appears that **my PSA won't hit 10 for at least 10 years thanks to Poly-MVA**.

#### Doubling time

2011-2012	1 year (no Poly-MVA)
2012-2013	2 years (4 tsp per day Poly-MVA)
March-June 2013	6 months (no Poly-MVA)
2013-2019	8 years (8 tsp per day Poly-MVA)
